Introduction

The following information is provided to clients of Trine Commerce Systems, Inc. and its system and network partners for integration of the payment gateway into their internal networks. These instructions can also be used to integrate a secure Web page form with the gateway.

Content

1. HTML Form Requirements ................................................................. 2

   4. e. Transaction Report Retrieval ........................................................... 10
5. HTML Responses From The Network ..................................................... 11
6. Legal Notice ....................................................................................... 11

1. HTML Form Requirements

Gateway URL: https://www.trinecs.net/processor/transact/form
Form method="post"
action="https://www.trinecs.net/processor/transact/form"
(Example form can be found at www.TrineCS.com/docs)

Test server: Use the Test Server URL for integration programming and testing. The hash provided for testing is unique to the testing environment. A new production hash will be provided upon completion of integration programming.

In all cases, replace the live server URL with the following:
https://test.trinecs.com/...

Required fields:

hash Hidden 32 character identification string assigned by the server.

response_type Hidden number telling the gateway what type of response it should have for a successful or a failed transaction. 1 means that the pages will be specified in the form fields response_success and response_failure and the browser will be forwarded to one of these pages. 0 means that the gateway will simply print out a page to the browser, successful or not.
response_success
This is the web page that a person should be forwarded to if the transaction has been successful. Must be a fully qualified and valid URL. Is only required if response_type = 1 and is a hidden field.

response_failure
The web page that a person will be forwarded to if the transaction is not successful. A form field called error will be appended to the URL and contains a comma separated list of reasons why the transaction failed. Must be a fully qualified and valid URL. Is only required if response_type = 1 and is a hidden field.

See the “HTML Response from Network” section below.

card_number The credit card number being processed.
card_date Expiration date on the card in the format of MM/YY
card_name Name of the cardholder.
amount Total amount of the transaction
transaction_type Specifies the type of transaction. In most cases:
<option value='SALE'>Purchase/Card Not Present</option>
The only transaction types supported in HTML forms is SALE or FORCE (voice authorization with auth code supplied).

2. Swipe/Magnetic Card Transactions

It is recommended to use the XML method for processing magnetic card transactions. It tends to be cleaner and provides more feedback fields. (See also 4. XML Processing.)

Gateway URL: https://www.trinecs.net/processor/transact/form (http post method)
https://www.trinecs.net/processor/transact/xml (xml method)

Required fields:
hash Hidden 32 character identification string assigned by the server.
mag_data Data from the card magnetic swipe. There are two methods for sending magnetic stripe data. Either A) send the entire mag stripe in the variable mag_data without the initial % or closing ? or B) send two separate fields: mag_track1 with track one data in it, and mag_track2 with track two data in it. For many purposes, track 1 is optional.
amount Total amount of the transaction
transaction_type Specifies the type of transaction. In most cases:
<option value='SALE'>Purchase/Card Not Present</option>
Transaction types supported are: SALE, CREDIT, PREAUTH, FORCE
pin_block For PIN debit transactions only. The pin number encrypted with the key provided to the card stripe reader device. The user enters their PIN on device, which encrypts the pin with the key provided by the network, and sends the results in this field.

ksn For PIN debit transactions only. Key Serial Number - part of the debit DUKPT (derived unique key per transaction scheme).

original_transaction Used only on Refund transactions to identify the original transaction being Refunded. This field should be populated with the original transaction number (<invoice_num>) returned by the gateway on the original.

3. Fields Available But Not Required

cvv2 The last three digits of the number printed on the back of the credit card (Mastercard/Visa, Discover). While not required, omission of this number may result in a downgrade of the transaction by the network. American Express uses a 4-digit card ID.

card_type Type of card (Visa, Mastercard, etc.)

name The billing name. While in most cases this would be the same as the cardholder’s name, it is kept separate just in case it is needed.

device_label Two numeric characters only. Used to distinguish between multiple devices using the same hash code/ Terminal ID.

goods_type eCommerce specific. Values: D (digital) or P (physical)

merchant_1 User-configurable fields. These fields may be visible or hidden. They do appear in email confirmations. 30 character limit each.

merchant_2

Other Billing/Information Fields:

city 2 digit state code, CA, TX, MB (Manitoba), etc.
country 2 digit ISO country code, US, CA, etc.

zip Zip code is required for AVS verification

phone

tax

country

zip

email

purchase_data Level 2 data for corporate purchase cards [varchar(17)].
Order Information

**description**
A free-text field describing what's been sold.

**sub_total**
Product/Service cost not including shipping or taxes

**shipping_type**
A free text field describing the shipping method. e.g. USPS Priority Mail

**shipping_cost**
Cost of shipping and/or handling

**tax**
Total sales tax charged

4. XML Processing

**Gateway URL**
https://www.trinecs.net/processor/transact/xml

Transaction types supported are:
SALE, CREDIT, PREAUTH, and FORCE (see 4.a. below)

**Additional fields available for transactions with fees:**
These fields are used only in very specific cases unique to government merchant transactions. They may be omitted if not used by the merchant.

**fee**
amount of fee

**feetrans_ident**
identifier of the fee

**feetrans_invnum**
invoice number of fee

**Example XML Request (with example text):**

```xml
<request>
  <hash>1a3255abdb5b764d66f79eb85d4dc</hash>
  <transaction_type>SALE</transaction_type>
  <response_type>0</response_type>
  <name>Buyer Name</name>
  <card_name>Name On Card</card_name>
  <card_number>0123456789</card_number>
  <card_type>VISA</card_type>
  <card_date>10/10</card_date>
  <card_entry>KEYED</card_entry> (alt: SWIPED)
  <company>Company Name</company>
  <address1>130 Company Address</address1>
  <address2>Suite #512</address2>
  <city>Company Town</city>
  <state>WA</state>
  <country>US</country>
  <zip>12345-6789</zip>
  <phone>123-456-7890</phone>
  <fax>123-456-7891</fax>
  <email>email@email.com</email>
  <purchase_data>12345678901234567</purchase_data>
  <shipping_name>Name Shipped To</shipping_name>
  <shipping_company>Company Name</shipping_company>
  <shipping_address1>130 Company Road</shipping_address1>
  <shipping_address2>Suite #512</shipping_address2>
  <shipping_city>Company Town</shipping_city>
  <shipping_state>WA</shipping_state>
  <shipping_country>US</shipping_country>
</request>
```
<shipping_zip>12345-6789</shipping_zip>
<description>Name of item ordered</description>
<invoice_num>1000</invoice_num>
<sub_total>10.00</sub_total>
<shipping_type>USPS Priority Mail</shipping_type>
<shipping_cost>2.00</shipping_cost>
<tax>1.00</tax>
<amount>13.00</amount>
<fee>1.00</fee>
<total>14.00</total>
<feetrans_ident>000123456</feetrans_ident>
<feetrans_invnum>12345</feetrans_invnum>

Example XML Response (with example text):
Success
<response>
  <isError>No</isError>
  <time>2001-06-13 20:24:30</time>
  <invoice_num>1000</invoice_num>
  <merchant_id>0001234</merchant_id> (from network)
  <cardholder_name>JOHN SMITH</cardholder_name> (from mag stripe)
  <card_type>VISA</card_type>
  <card_entry>KEYED</card_entry>
  <account>xxxxxxxxxxxx7890</account> (masked to last 4 digits)
  <expiration_date>10/10</expiration_date>
  <feetrans_ident>000123456</feetrans_ident>
  <feetrans_invnum>12345</feetrans_invnum>
  <amount>13.00</amount>
  <balance>0.00</balance> (if sent by network only)
  <fee>1.00</fee>
  <total>14.00</total>
</response>

*Fee fields may be omitted if no fee is included. (Fees are set by the Merchant per terminal and are applied automatically, if set.)

Error
<response>
  <isError>Yes</isError>
  <error>Bad Card Number</error>
  <error>Bad Name on card</error>
</response>

4. a. Processing Void Transactions

Purpose
To Void a previously processed transaction.

Process
The original transaction will return an identifier that is unique to the transaction. This identifier may vary by processor. The identifier is then used in a second transaction in the invoice_num field, with VOID as the transaction_type.

URL
https://www.trinecs.net/processor/transact/xml
Example XML Request (with example text):

```
<request>
  <transaction_type>VOID</transaction_type>
  <invoice_num>123</invoice_num>
  <hash_id>123124124124</hash_id>
</request>
```

Example XML Response (with example text):

Success

```
<response>
  <isError>No</isError>
  <time>2007-20-10 12:12:34</time>
  <invoice_num>123</invoice_num>
</response>
```

Error

```
<response>
  <isError>Yes</isError>
  <error>Some Error Message</error>
</response>
```

4. b. Special Case: Fee Information Request

Purpose: Through an xml api call, request a fee calculation for an amount on a particular terminal.

Card URL: https://www.trinecs.net/processor/transact/feeinfo

Fields:

- amount: amount requested
- fee: calculated fee for given amount
- basefee: base fee applied
- feepercent: percentage applied
- card_type: accepted values: pindebit, pinless, creditcard
- card_number: card number

**Card Type** and **Card Number** fields are required in order to determine the fee for Visa Pin Debit Amount, a special case when a visa pin debit request or a visa pinless debit request is sent to the gateway to determine the fee amount.

Calculation algorithm:
The fee field has been pre-calculated for you. The basefee and feepercent is extra data that you may or may not need (e.g. in case you need to explain how the fee was calculated).

```
if (amount * feepercent/100) > basefee
    return amount * feepercent;
else
    return basefee;
```

Example XML Request (with example text):
<request>
<hash>123124124214</hash> *
<amount>10.00</amount>
<card_type>pindebit</card_type>
<card_number>4111111111111111</card_number>
</request>

* The hash for a terminal with an associated terminal to accept the fee is required. This is set on the gateway by the merchant account representative.

Example XML Response (with example text):

Success Case:  
<response>
<isError>No</isError>
<time>2015-07-23 14:23:00</time>
<amount>10.00</amount>
<fee>1.00</fee>
<basefee>1.00</basefee>
<feepercent>2.3</feepercent>
</response>

Failure Case:  
<response>
<isError>Yes</isError>
<error>Invalid User</error>
</response>

4. c. Optional Fields Not Communicated to Network – Internal Use Only

- terminal_vendor maxlen: 40 char  
  Indicates the vendor of the device sending the query.
- terminal_model maxlen : 40 char  
  Indicates the model of the device sending the query.
- terminal_serial maxlen: 40 charl  
  Indicates the serial number of the device sending the query.
- terminal_prev_response maxlen: 40 char  
- terminal_sequence maxlen: 40 char  
  Sequence number that device has for transaction.
- device_transaction maxlen:40 char  
  This should be a UNIQUE identifier for EACH transaction done on the device. It is up to the developer to insure uniqueness within the set of transactions done on that device.

  The device_transaction field can be used to query the results of the transaction after the transaction is complete using the QUERY xml request and passing the device_transaction in the request.

  If the developer does not maintain uniqueness, a QUERY request will indicate invalid device_transaction as an error.
Sample QUERY request:

```xml
<request>
  <hash>EEC2FA7D9BDB327C4BC307B513279558</hash>
  <response_type>0</response_type>
  <transaction_type>QUERY</transaction_type>
  <device_transaction>12312412412412</device_transaction>
</request>
```

4. d. No Response/No Data Received Failures

**Discussion:** Sometimes devices send a request but do not receive a response back. Trine offers a way to request the response that was missed:

**URL:** For Cards: /processor/cardresponse/xml

**Request format:**

```xml
<request>
  <hash>12312412412</hash>
  <device_transaction>1234</device_transaction>
</request>
```

Where device_transaction is the transaction id that was sent to the gateway.

It assumes that device transactions are unique to the merchant. This facility can only be used if the developer uses a device transaction and sends that to the gateway at the time that the transaction occurs.

The response that comes back will either indicate:

ERROR: some kind of error occurred.

ERROR – will be the first 5 letters.

OR

It will return the exact response that would have been returned in the event the gateway processed a transaction.

It will look something like

```xml
<response>
  ..... 
</response>
```

This may indicate an actual error in the processing or the successful result.

4. e. Transaction Report Retrieval

**Purpose:** Transactions for any date and terminal can be downloaded for integration to client networks and programs.
URL: https://www.trinecs.net/virtual/report/transactions

Fields
<hash> Required
<passcode> Required – Set as an option in the merchant terminal
<date> Optional – Default is current date

Fields Returned
The following fields are returned if not blank. Blank fields are NOT returned.

transaction_date shipping_cost
display_trantype card_type_code
status shipping_name
terminal_id shipping_address1
card_number shipping_address2
approval_code * shipping_city
name shipping_state
company shipping_zip
card_number card_name
name merchant_1
city merchant_2
state ipaddress
country transaction_identifier
phone convenience_fee
fax is_pintx
email is_mag
amount is_pinless
sub_total cvv_meaning
tax auth_network_name
description void_indicator
shipping_type

* <approval_code> is the network’s authorization (auth) code.

Sample Request (Actual on test server)
http://test.trinecs.com/virtual/report/transactions?hash=6aefa59be60983b3a6a5a6bfbe5988ee&date=2009-05-10&passcode=fancypass

Example XML Response (with example text):
<report_transactions date='2015-05-10'>
<transaction>
  <id>622</id>
  <transaction_date>2015-05-10 02:00:07</transaction_date>
  <display_trantype>SALE</display_trantype>
  <status>FAIL</status>
  <terminal>fdadmin</terminal>
  <card_number>************1111</card_number>
  <name>Tom</name>
  <address1>789</address1>
  <city>Harrisburg</city>
  <state>PA</state>
  <country>US</country>
  <email>denavinson@austin.rr.com</email>
</transaction>
</report_transactions>
<amount>5.00</amount>
<sub_total>0</sub_total>
<tax>0</tax>
<shipping_cost>0</shipping_cost>
<shipping_city>Harrisburg</shipping_city>
<shipping_state>PA</shipping_state>
<card_name>Tom</card_name>
<ipaddress>74.92.222.101</ipaddress>
$convenience_fee>0</convenience_fee>
<is_pintx>N</is_pintx>
<is_mag>N</is_mag>
<is_pinless>Y</is_pinless>
<void_indicator>n</void_indicator>
</transaction>
</report_transactions>

5. HTML Responses From The Network

Responses from the network to HTML form processing are handled by hidden field settings in the form. (See response_type in “HTML Form Requirements” above.) Either a simple page with the transaction information will be displayed, or the Gateway can be set to forward the response information to a client-defined Web page. Separate “success” and “error” pages are needed for custom network responses. These are defined in the Required form fields section.

A field named “message” is returned upon a successful transaction, or a field named “error” on a failed transaction. The existence of one of those fields will indicate a failed or successful transaction. The field returned will contain either transaction information, if successful, or an error message, and is automatically added to the end of the redirecting URL. Standard HTML does not support this functionality. It will require a programming to display this.

6. Legal Notice

This program and coding information is intellectual property owned by Trine Commerce Systems, Inc., Austin, Texas. No part of the coding or program may be used without authorization.
